RM Bridge
2D/3D/4D Bridge Design, Analysis, Fabrication, and Construction

Bridge engineers need a single, flexible design and analysis solution capable of solving intensive engineering challenges while addressing a full spectrum of structural, material, performance, and construction issues.

Integrated Documentation Workflows

The CONNECT Edition provides a common environment for comprehensive project delivery and connects users, projects, and your enterprise. With the CONNECT Edition, you now have a personal portal to access learning, communities, and project information. Your project teams can review project details and status, and gain visibility into project performance with the new project portal. Your project team may also wish to take advantage of the new ProjectWise® Connection Services including Project Performance Dashboards, Issues Resolution, and Scenario Services.

Top Performing Bridges

RM Bridge is comprehensive software for structural design and analysis. It supports today's advanced understanding of bridge building to produce accurate, dependable results for all bridge types, classes, and materials. The software streamlines typically massive analytical tasks, handling complex engineering issues while enabling users to achieve substantial time savings.

Used worldwide by consulting engineering firms, government transportation organizations, contractors, and project consortia, RM Bridge sets the standard for

Why RM Bridge? Focused and Dependable

Many software design applications are developed for multiple types of structures. Ultimately, they only partially address the unique nature of bridges. RM Bridge was designed specifically for bridges — by bridge engineers directly engaged in many of the world's most renowned bridge projects.

RM Bridge has evolved in practice over several decades into a globally recognized, expert system capable of solving virtually any bridge design or analysis problem. It stands unchallenged as the most technically robust bridge software, offering the highest level of computational functionality and automatic conformance to design codes.

The value of RM Bridge is further strengthened by Bentley's strong customer support network, which focuses on helping bridge designers and engineers gain the most from their investment in this innovative software.
both routine and signature bridge design and delivery. Routinely deployed on record-breaking projects, it continues to grow its reputation for solving complex engineering challenges. Engineers use RM Bridge to solve virtually any engineering challenge, and they depend on the software to deliver more than structural analysis results. RM Bridge enables engineers to take a more integrated approach in the creation and construction of bridge systems, which in turn reduces risk and helps deliver top-performing bridges.

Comprehensive, Integrated Solution
RM Bridge is a family of integrated software applications that enables users to solve engineering problems in a single engineering environment. Engineering organizations no longer spend valuable time re-inputting information or re-engineering data midstream. RM Bridge users develop and analyze a consistent bridge model in a continuous cycle, greatly increasing engineering efficiency. The system ensures accuracy and fidelity of the bridge information as it is seamlessly reused, refined, and reprocessed across the design, engineering, and construction phases.

RM Bridge also performs 4D time-dependent analysis, providing immeasurable benefits throughout the design-to-construction process. The ability to model a bridge over time brings a wealth of analysis possibilities and delivers real-world results for construction sequencing and erection control. Through time-stepped analysis, engineers can consider all types of nonlinearity.

Comprehensive analysis and proof-checking procedures can be run at any time. RM Bridge allows easy modification of bridge model parameters so that users can quickly make changes without recreating new parametric and analytical models. The system comprehensively analyzes all changes for all results.

Real-world Construction Engineering
RM Bridge offers extensive construction planning and engineering solutions. The system takes into account time-dependent material characteristics such as creep, shrinkage, and relaxation as the user computes the construction sequence. Engineers investigate in detail the different states in stage-wise construction – comparing results, detecting the relevant states, and producing result envelopes for proof checking.

RM Bridge enables users to solve structural problems and conflicts before construction begins, resulting in project savings. During construction, RM Bridge is used to monitor the position of a structure in real time and ensure construction to an exact, predefined position or gradient. This reduces errors and prevents costly rectification during construction.

RM Bridge and RM Bridge Advanced
RM Bridge and RM Bridge Advanced are the fundamental products in the RM Bridge offering. RM Bridge is the software used for standard static and dynamic applications. RM Bridge Advanced addresses more complex requirements and supports work in an international environment, with all implemented design codes available. RM Bridge Advanced can also be complemented with special-purpose add-on modules.

Both products include a 2D/3D/4D modeling engine, a sophisticated bridge solver, and a structural database that works in sync to manage all bridge information, from creation to completion.

RM Bridge and RM Bridge Advanced enable users to design the majority of concrete, steel, and composite structures, plan construction staging, perform erection control, construction engineering, and more.

The RM Bridge Offering Contains:
- Data exchange with civil engineering applications
- 3D parametric modeling of any bridge type and cross-section
- 4D construction schedule definition for more construction schedule variants
- Time-dependent effects analysis for local and international standards
- Wizards for standard bridge types for different local environments
- Special functionality for cantilever bridge technology
- Pre- and post-tensioned design, including internal and external tendons
- Powerful load management and factorized combinations for local and international standards
- Full structural analysis and design
- Hybrid finite-element modeling (FEM)
- Construction-stage engineering
- Traffic loading analysis with pre-defined templates
- 4D static and dynamic analysis
- Second-order theory and stability checking
- Seismic analysis in modal and time domain
- Material non-linearity, including international rules for time dependent functions (creep, shrinkage, steel relaxation)
- Cracked tensile zones analysis for local and international standards
- Concrete reinforcement design for local and international standards
Specialized Advanced Applications with RM Bridge

RM Bridge Advanced Non-linear • Geometric and material non-linearity options can be used for special purposes (consideration of large deflections, hysteretic effects in material non-linearity and special types of non-linear spring elements, push over analysis).

RM Bridge Advanced Cable • Special option for non-linear calculation of cable-stayed and suspension bridges, including calculation of non-linear effects of cable sagging. The powerful solver ADDCON allows for form finding process of suspension bridges and optimizing cable tensioning sequences in linear and non-linear analysis for final and stage analysis process.

RM Bridge Advanced Dynamics • The Advanced Seismic Analysis features are used for non-linear Time History calculations and consideration of highly non-linear damping devices, as well as specialized Rolling Stock analysis for high-speed rail design. Analyze loads, oscillation behavior, and location of resonance velocities for high-speed rail.

RM Bridge Advanced Wind • This option offers CFD calculations simulating wind tunnel tests by calculating aerodynamic coefficients and their derivatives using computational fluid dynamics. It enables users to perform relevant wind design code checks (Vortex Shedding, Across wind galloping, Torsional divergence, Classical and Torsional Flutter) and sophisticated wind buffeting analyses, taking into account dynamic wind effects.

RM Bridge Advanced Construction • Functionality for the design of special construction procedures (e.g. Incremental Launching Method), and construction engineering tasks, erection monitoring and control with exact camber calculation and determining required compensation measure in case of deviations from the design state.

RM Bridge Cast • Helps construction engineers with segment-by-segment casting of precast segmental bridges. It provides precision control of geometry for segment casting using RM Bridge camber design calculations results.

Bridge Information Modeling

BrIM: A Synthesis of Planning, Engineering, Design, and Construction

With the integrated process of RM Bridge, users synergistically develop a precise bridge data model that improves overall project accuracy and consistency. The results provide important information that proves to be a useful asset, not just for the design phase but also for the life of the bridge.

This synthesis of bridge information development can carry through all the project phases, from conception to detailed design, design to fabrication and manufacturing, and construction to operations. Bridge information modeling or BrIM is a practice that endeavors to enable any person requiring information about a given bridge to access and reuse information relevant to his or her purpose during the lifecycle of the infrastructure.

For example, a structural detailer can access rebar information, a bridge modeler can extract key design measurements, and a road design engineer can access the exact geometry and position of the bridge deck from accurate as-built information. Moreover, bridge owners can access historical trending, traffic analysis, and cost information along with physical models of the infrastructure for capital project planning.
Integration with Civil/Road/Rail Engineering Applications

RM Bridge enables users to work with an array of project information – alignment data, vertical profiles, digital terrain models (DTM), isolines (contours), coordinate geometry (COGO), and surface point data – in DGN, DWG, and common raster file data formats.

Likewise, the bridge design model data created in RM Bridge can be exported via LandXML for use in a host of parallel and downstream processes.

The sharing of road and bridge data is even more streamlined for users of the MicroStation® platform and the many software families that it supports. RM Bridge shares data with these systems, which include InRoads®, GEOPAK, MXROAD®, and Bentley Rail Track. It also supports common content publishing tools, allowing users to write files and models to Adobe PDF or Universal 3D (U3D) format.

Bentley Bridge Solution

Bentley is committed to providing software that helps engineering professionals design and deliver high-quality, sustainable infrastructure. RM Bridge is a major offering within the Bentley bridge solution, which also includes world-class applications for road design, digital terrain modeling, bridge design, structural engineering and analysis, steel detailing, concrete reinforcement, and bridge load rating and analysis.

RM Bridge is compatible with MicroStation, Bentley’s common design platform, and ProjectWise, Bentley’s platform for connecting people and information across project teams. This integration substantially broadens the movement of data not only within the bridge delivery disciplines (planning through construction) but also across the life of the bridge.

Running RM Bridge with ProjectWise and/or Bentley Navigator, users are able to perform a synthesis of bridge information modeling, continuously sharing, reusing, and repurposing data. They enjoy the many benefits of real-time collaboration and streamlined engineering content management – working across multiple locations and time zones, among numerous contributors, companies, and stakeholders.

With this system, data integration happens at a fairly granular level, enabling users to:

- Browse quickly for the right information, including legacy bridge data
- Create an array of structure and infrastructure project models and flyarounds
- Utilize raster and other data formats
- Check for geometrical conflicts in the multi-discipline infrastructure model
- Simulate and manage construction schedules

By implementing the Bentley bridge solution, users enjoy the full benefits of a real-world solution for delivery, maintenance, and operation of bridge systems, and improve ROI in data at every step of the bridge lifecycle.
